diabetes is a disease in which a mammal's ability to regulate glucose levels in the blood is impaired because the mammal has a reduced ability to convert glucose to glycogen for storage in muscle and liver cells. In Type I diabetes, this reduced ability to store glucose is caused by reduced insulin production. "Type II Diabetes" or "non-insulin dependent diabetes mellitus" (NIDDM) is the form of diabetes which is due to a profound resistance to insulin stimulating or regulatory effect on glucose and lipid metabolism in the main insulin-sensitive tissues, muscle, liver and adipose tissue. This resistance to insulin responsiveness results in insufficient insulin activation of glucose uptake, oxidation and storage in muscle and inadequate insulin production of lipolysis in adipose tissue and of glucose production and secretion in liver. When these cells become desensitized to insulin, the body tries to compensate by producing abnormally high levels of insulin and hyperinsulenia results. Hyperinsulenia is associated with hypertension and elevated body weight. Since insulin is involved in promoting the cellular uptake of glucose, amino acids and triglycerides from the blood by insulin sensitive cells, insulin insensitivity can result in elevated levels of triglycerides and LDL which are risk factors in cardiovascular diseases. The constellation of symptoms which includes hyperinsulenia combined with hypertension, elevated body weight, elevated triglycerides and elevated LDL is known as Syndrome X.

Current treatment for diabetes mellitus generally first involves treatment with diet and exercise. However, compliance can be poor and as the disease progresses treatment with hypoglycemics, typically sulfonylureas, is

5
10
15
20
25

often necessary. Sulfonylureas stimulate the β cells of the liver to secrete more insulin. However, the response of the β cells eventually fails and treatment with insulin injection is necessary. In addition, both sulfonylurea treatment and insulin injection have the life threatening side effect of hypoglycemic coma. Therefore, patients using these treatments must carefully control dosage.

Thiazolidinediones are a class of compounds which have been shown to increase the sensitivity of insulin sensitive cells. Increasing insulin sensitivity rather than the amount of insulin in the blood reduces the likelihood of hypoglycemic coma. Thiazolidinediones have been shown to increase insulin sensitivity by binding to PPAR γ receptors. However, side effects associated with treatment with thiazolidinediones include weight gain, and, for troglitazone, liver toxicity.

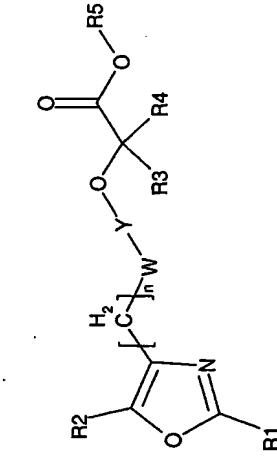

PPAR α and PPAR γ receptors have been implicated in diabetes mellitus, cardiovascular disease, obesity, and gastrointestinal disease, such as, inflammatory bowel disease. There exists a need for new pharmaceutical agents which modulate these receptors to prevent, treat and/or alleviate these diseases or conditions while ameliorating side effects of current treatments.

SUMMARY OF THE INVENTION

The present invention is directed to compounds represented by Structural Formula I and pharmaceutically acceptable salts, solvates and hydrates thereof:

Structural Formula I

In Structural Formula I, R1 is an unsubstituted or 10 substituted group selected from aryl, heteroaryl, cycloalkyl, aryl-C1-C4 alkyl, heteroaryl-C1-C4 alkyl or cycloalkyl-C1-C4 alkyl. R2 is H, C1-C4 alkyl or C1-C4

haloalkyl. The polymethylene chain, is saturated or may contain a carbon-carbon double bond, while n is 2, 3, 15 or 4. W is O or S. Y is an unsubstituted or substituted group selected from phenylene, naphthylene or 1,2,3,4 tetrahydronaphthylene. R3 is H, C1-C6 alkyl or C1-C6 haloalkyl. R4 is H, C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or unsubstituted benzyl. However, when R3 and 20 R4 are H, R2 is C1-C4 alkyl or C1-C4 haloalkyl. R5 is H, C1-C4 alkyl or aminoalkyl.

In one embodiment, the present invention also relates to pharmaceutical compositions which comprising at least one

- 5 -

compound of the present invention, or a pharmaceutically acceptable salt, solvate, hydrate or prodrug thereof, and a pharmaceutically acceptable carrier.

In another embodiment, the present invention relates to 5 a method of modulating a peroxisome proliferator activated receptor by contacting the receptor with at least one compound represented by Structural Formula I, and pharmaceutically acceptable salts, solvates and hydrates thereof

10 In a further embodiment, the present invention relates to a method of making a compound represented by Structural Formula I.

The compounds of the present invention and pharmaceutically acceptable salts, solvates and hydrates thereof are believed to be effective in treating Syndrome X, Type II diabetes, hyperlipidemia, hypertension, obesity, coagulopathy, hypertension, atherosclerosis, and other disorders related to Syndrome X and cardiovascular diseases because they lower one or more of the following in mammals: 15 glucose, insulin, triglycerides, fatty acids and/or cholesterol. In addition, the compounds exhibit fewer side effects than compounds currently used to treat these conditions.

DETAILED DESCRIPTION OF THE INVENTION

The terms used to describe the instant invention have the following meanings herein.

As used herein, alkyl groups include straight chained

5 or branched C1-C6 hydrocarbons, which are saturated or unsaturated.

Cycloalkyl groups, as used herein, include C3-C8 hydrocarbons, which are partially or completely saturated.

As used herein, aryl groups include carbocyclic aromatic ring systems (e.g. phenyl), fused polycyclic aromatic ring systems (e.g. naphthyl and anthracenyl) and aromatic ring systems fused to carbocyclic non-aromatic ring systems (e.g., 1,2,3,4-tetrahydronaphthyl).

10 Heteroaryl groups, as used herein, is an aromatic ring system having at least one heteroatom such as nitrogen, sulfur or oxygen. Heteroaryl groups include thiienyl (also referred to herein as "thiophenyl"), pyridyl, pyrrolyl, benzofuranyl, isoxazolyl, and pyrimidinyl.

An aryl-C1-C4-alkyl group, as used herein, is an aryl substituent that is linked to a compound by a saturated or unsaturated alkyl group having from one to four carbon atoms.

15 A heteroaryl-C1-C4-alkyl group, as used herein, is a heteroaryl substituent that is linked to a compound by a saturated or unsaturated alkyl group having from one to four carbon atoms.

A cycloalkyl-C1-C4-alkyl group, as used herein, is a cycloalkyl substituent that is linked to a compound by a saturated or unsaturated alkyl group having from one to four carbon atoms.

An aminoalkyl group is an alkyl group having from one to six carbon atoms which is substituted with at least one

- 7 -

amine represented by -NR12R12 in which each R12 are, independently, a C1-C6 alkyl or both R12 taken together with the nitrogen to which they are attached form a five or six membered heterocycloalkyl.

5 A heterocycloalkyl is a non-aromatic ring which contains one or more oxygen, nitrogen or sulfur (e.g., morpholine, piperidine, piperazine, pyrrolidine, and thiomorpholine). The preferred heterocycloalkyl group is morpholine.

10 Substituents for aryl, heteroaryl and cycloalkyl groups include halo, hydroxy, carboxy, saturated or unsaturated C1-C4 alkyl, C1-C4 alkoxy, C1-C4 haloalkyl, C1-C4 haloalkoxy, cyano, carbamoyl, dioxaborolan-2-yl, benzoyl, or a substituted or unsubstituted group selected from aryl-C1-C4-alkyl, aryl oxy, cycloalkyl, cycloalkyloxy or heterocyclo-oxy. Substituents for heteroaryl groups further include biphenyl. Preferred substituents for aryl are independently selected from CR₃, carboxy, saturated or unsaturated C1-C4 alkyl, C1-C4 alkoxy, C1-C4 haloalkyl, C1-C4 haloalkoxy, 15 cyano, carbamoyl, dioxaborolan-2-yl, benzoyl, or a substituted or unsubstituted group selected from aryl-C1-C4-alkyl, aryl oxy, cycloalkyl, cycloalkyloxy or heterocyclo-oxy.

20 Substituents for the phenylene, naphthylene or 1,2,3,4 tetrahydronaphthylene groups include halo, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-C1-C4 alkyl, or aryl-C1-C4 alkyl.

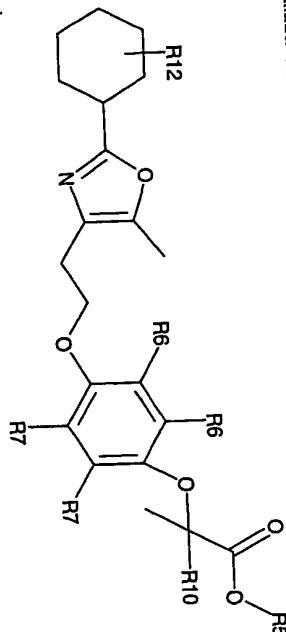

25 Preferably, the compounds of the present invention, and with their respective pharmaceutical compositions, have a structure represented by Structural Formula II:

30

- 10 -

C4 alkoxy, C1-C4 haloalkyl, C1-C4 haloalkoxy, cyano, carbamoyl, dioxaborolan-2-yl, benzoyl, or a substituted or unsubstituted group selected from aryl-C1-C4-alkyl, aryloxy, cycloalkyl, cycloalkyloxy or heterocyclo-oxyl.

5 In another preferred embodiment, the compounds of the present invention, and with their respective pharmaceutical compositions, have a structure represented by Structural Formula IV:

10 Structural Formula IV

In Structural Formula IV, R5, R6, R7 and R10 are as defined for Structural Formulas I and II while R12, which is a substituent at the 1, 2, 3 or 4 carbon position of the cyclohexyl, is H, aryl or C1-C4 alkyl.

15 The compounds of Structural Formula I may contain one or more chiral centers, and exist in different optically active forms. When compounds of Structural Formula I contain one chiral center, the compounds exist in two enantiomeric forms and the present invention includes both enantiomers and mixtures of enantiomers, such as racemic mixtures. The enantiomers may be resolved by methods known to those skilled in the art, for example by formation of diastereoisomeric salts which may be separated, for example, by crystallization; formation of diastereoisomeric

- 11 -

derivatives or complexes which may be separated, for example, by crystallization, gas-liquid or liquid chromatography; selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic

5 esterification; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support for example silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where the desired enantiomer is converted into another chemical entity

10 by one of the separation procedures described above, a further step is required to liberate the desired enantiomeric form. Alternatively, specific enantiomers may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents, or by 15 converting one enantiomer into the other by asymmetric transformation.

When a compound represented by Structural Formula I has

more than one chiral substituent it may exist in diastereoisomeric forms. The diastereoisomeric pairs may be

20 separated by methods known to those skilled in the art, for example chromatography or crystallization and the individual enantiomers within each pair may be separated as described above. The present invention includes each diastereoisomer of compounds of Structural Formula I and mixtures thereof.

25 Certain compounds of Structural Formula I may exist in different stable conformational forms which may be separable. Torsional asymmetry due to restricted rotation about an asymmetric single bond, for example because of steric hindrance or ring strain, may permit separation of 30 different conformers. The present invention includes each conformational isomer of compounds of Structural Formula I and mixtures thereof.

- 12 -

Certain compounds of Structural Formula I may exist in zwitterionic form and the present invention includes each zwitterionic form of compounds of Structural Formula I and mixtures thereof.

5 Certain compounds of Structural Formula I and their salts may exist in more than one crystal form. Polymorphs of compounds represented by Structural Formula I form part of this invention and may be prepared by crystallization of a compound of Structural Formula I under different conditions. For example, using different solvents or 10 different solvent mixtures for recrystallization; crystallization at different temperatures; various modes of cooling, ranging from very fast to very slow cooling during crystallization. Polymorphs may also be obtained by heating or melting a compound of Structural Formula I followed by gradual or fast cooling. The presence of polymorphs may be determined by solid probe nmr spectroscopy, ir spectroscopy, differential scanning calorimetry, powder X-ray diffraction or such other techniques.

15 Certain compounds of Structural Formula I and their salts may exist in more than one crystal form and the present invention includes each crystal form and mixtures thereof.

Certain compounds of Structural Formula I and their salts may also exist in the form of solvates, for example 20 hydrates, and the present invention includes each solvate and mixtures thereof.

25 "Pharmaceutically-acceptable salt" refers to salts of the compounds of the Structural Formula I which are substantially non-toxic to mammals. Typical pharmaceutically-acceptable salts include those salts prepared by reaction of the compounds of the present

- 13 -

invention with a mineral or organic acid or an organic or inorganic base. Such salts are known as base addition salts, respectively. It should be recognized that the particular counterion forming a part of any salt of this invention is not of a critical nature, so long as the salt as a whole is pharmaceutically-acceptable and as long as the counterion does not contribute undesired qualities to the salt as a whole.

5 By virtue of its acidic moiety, a compound of Structural Formula I forms salts with pharmaceutically acceptable bases. Some examples of base addition salts include metal salts such as aluminum; alkali metal salts such as lithium, sodium or potassium; and alkaline earth metal salts such as calcium, magnesium, ammonium, or substituted ammonium salts. Examples of substituted ammonium salts include, for instance, those with lower alkylamines such as trimethylamine, triethylamine; hydroxalkylamines such as 2-hydroxyethylamine, bis-(2-hydroxyethyl)-amine or tri-(2-hydroxyethyl)-amine, 10 cycloalkylamines such as bicyclohexylamine or dibenzylpiperidine, N-benzyl- β -phenethylamine, dehydroabietylamine, N,N'-bisdehydro-abietylamine, glucamine, N-methylglucamine; bases of the pyridine type such as pyridine, collidine, quinine or quinoline; and salts 15 of basic amino acids such as lysine and arginine. Examples of inorganic bases include, without limitation, sodium hydroxide, potassium hydroxide, potassium carbonate, sodium carbonate, sodium bicarbonate, potassium bicarbonate, calcium hydroxide, calcium carbonate, and the like.

30

- 14 -

- 15 -

Compounds of Structural Formula I, which are substituted with a basic group, may exist as salts with pharmaceutically acceptable acids. The present invention includes such salts. Examples of such salts include hydrochlorides, hydrobromides, sulfates, methanesulfonates, nitrates, maleates, acetates, citrates, fumarates, tartrates [e.g. (+)-tartrates, (-)-tartrates or mixtures thereof including racemic mixtures], succinates, benzoates and salts with amino acids such as glutamic acid.

These salts may be prepared by methods known to those skilled in the art.

Certain compounds of Structural Formula I and their salts may also exist in the form of solvates, for example hydrates, and the present invention includes each solvate and mixtures thereof.

Prodrugs are compounds of the present invention, which have chemically or metabolically cleavable groups and become by solvolysis or under physiological conditions the compounds of the invention which are pharmaceutically active in vivo. Prodrugs include acid derivatives well known to practitioners of the art, such as, for example, esters prepared by reaction of the parent acidic compound with a suitable alcohol, or amides prepared by reaction of the parent acid compound with a suitable amine. Simple aliphatic or aromatic esters derived from acidic groups dependent on the compounds of this invention are preferred prodrugs. In some cases it is desirable to prepare double ester type prodrugs such as (acyloxy) alkyl esters or ((alkoxycarbonyl)oxy)alkyl esters. Particularly preferred esters as prodrugs are methyl, ethyl, propyl, isopropyl, n-butyl, isobutyl, tert-butyl, morpholinoethyl, and N,N-diethylglycolamido.

Methyl ester prodrugs may be prepared by reaction of the acid form of a compound of Formula I in a medium such as methanol with an acid or base esterification catalyst (e.g., NaOH, H₂SO₄). Ethyl ester prodrugs are prepared in similar fashion using ethanol in place of methanol.

Morpholinylethyl ester prodrugs may be prepared by reaction of the sodium salt of a compound of Structural Formula I (in a medium such as dimethylformamide) 4-(2-chloroethyl)morphine hydrochloride (available from Aldrich Chemical Co., Milwaukee, Wisconsin USA, Item No. C4,220-3).

The term, "active ingredient" means the compounds generically described by Structural Formula I as well as the salts, solvates, and prodrugs of such compounds.

The term "pharmaceutically acceptable" means that the carrier, diluent, excipients and salt must be compatible with the other ingredients of the composition, and not deleterious to the recipient thereof. Pharmaceutical compositions of the present invention are prepared by procedures known in the art using well known and readily available ingredients.

"Treating" refers to reducing the likelihood that the recipient will incur or develop any of the pathological conditions described herein.

"Treating" refers to mediating a disease or condition and preventing, or mitigating, its further progression or ameliorate the symptoms associated with the disease or condition.

"Pharmaceutically-effective amount" means that amount of a compound, or of its salt, solvate, hydrate or prodrug thereof, that will elicit the biological or medicinal response of a tissue, system, or mammal. Such an amount can be

- 16 -

administered prophylactically to a patient thought to be susceptible to development of a disease or condition. Such amount when administered prophylactically to a patient can also be effective to prevent or lessen the severity of the mediated condition. Such an amount is intended to include an amount which is sufficient to modulate a PPAR receptor, such as a PPAR_α or PPAR_γ receptor, which mediate a disease or condition. Conditions mediated by PPAR_α or PPAR_γ receptors include diabetes mellitus, cardiovascular disease, Syndrome X, obesity and gastrointestinal disease.

A "mammal" is an individual animal that is a member of the taxonomic class Mammalia. The class Mammalia includes humans, monkeys, chimpanzees, gorillas, cattle, swine, horses, sheep, dogs, cats, mice, and rats.

Administration to a human is most preferred. The human to whom the compounds and compositions of the present invention are administered has a disease or condition in which control blood glucose levels are not adequately controlled without medical intervention, but wherein there is endogenous insulin present in the human's blood. Non-insulin dependent diabetes mellitus (NIDDM) is a chronic disease or condition characterized by the presence of insulin in the blood, even at levels above normal, but resistance or lack of sensitivity to insulin action at the tissues. The compounds and compositions of the present invention are also useful to treat acute or transient disorders in insulin sensitivity, such as sometimes occur following surgery, trauma, myocardial infarction, and the like. The compounds and compositions of the present invention are also useful for lowering serum triglyceride levels. Elevated triglyceride level, whether caused by

- 17 -

genetic predisposition or by a high fat diet, is a risk factor for the development of heart disease, stroke, and circulatory system disorders and diseases. The physician of ordinary skill will know how to identify humans who will benefit from administration of the compounds and compositions of the present invention.

The present invention further provides a method for the treatment and/or prophylaxis of hyperglycemia in a human or non-human mammal which comprises administering an effective, non-toxic amount of a compound of the general formula (I), or a tautomeric form thereof and/or a pharmaceutically acceptable salt thereof and/or a pharmaceutically acceptable solvate thereof to a hyperglycemic human or non-human mammal in need thereof.

They are useful as therapeutic substances in preventing or treating Syndrome X, diabetes mellitus and related endocrine and cardiovascular disorders and diseases in human or non-human animals.

The invention also relates to the use of a compound of Formula I as described above, for the manufacture of a medicament for treating a PPAR_α or PPAR_γ mediated condition, separately or in combination.

A therapeutically effective amount of a compound of Structural Formula I can be used for the preparation of a medicament useful for treating Syndrome X, diabetes, treating obesity, lowering triglyceride levels, raising the plasma level of high density lipoprotein, and for treating, preventing or reducing the risk of developing atherosclerosis, and for preventing or reducing the risk of having a first or subsequent atherosclerotic disease event in mammals, particularly in humans. In general, a

- 18 -

- 19 -

therapeutically effective amount of a compound of the present invention (1) typically reduces serum glucose levels, or more specifically HbA_{1c}, of a patient by about 0.7% or more; (2) typically reduces serum triglyceride levels of a patient by about 20% or more, and (3) increases serum HDL levels in a patient. Preferably, HDL levels will be increased by about 30% or more.

Additionally, an effective amount of a compound of

Structural Formula I and a therapeutically effective amount of one or more active agents selected from a group of one or more active agents consisting of: antihyperlipidemic agent, plasma HDL-raising agents, antihypercholesterolemic agents, fibrates, vitamins, aspirin, insulin secretagogues, insulin and the like can be used together for the preparation of a medicament useful for the above-described treatments.

Advantageously, compositions containing the compound of Structural Formula I or the salts thereof may be provided in dosage unit form, preferably each dosage unit containing from about 1 to about 500 mg be administered although it will, of course, readily be understood that the amount of the compound or compounds of Structural Formula I actually to be administered will be determined by a physician, in the light of all the relevant circumstances.

When used herein Syndrome X includes pre-diabetic insulin resistance syndrome and the resulting complications thereof, insulin resistance, non-insulin dependent diabetes, dyslipidemia, hyperglycemia obesity, coagulopathy, hypertension and other complications associated with diabetes. The methods and treatments mentioned herein include the above and encompass the treatment and/or prophylaxis of any one of or any combination of the following: pre-diabetic insulin resistance syndrome, the

resulting complications thereof, insulin resistance, Type II or non-insulin dependent diabetes, dyslipidemia, hyperglycemia, obesity and the complications associated with diabetes including cardiovascular disease, especially atherosclerosis.

The compositions are formulated and administered in the same general manner as detailed herein. The compounds of the instant invention may be used effectively alone or in combination with one or more additional active agents

depending on the desired target therapy. Combination therapy includes administration of a single pharmaceutical dosage formulation which contains a compound of Structural Formula I and one or more additional active agents, as well as administration of a compound of Structural Formula I and each active agent in its own separate pharmaceutical dosage formulation. For example, a compound of Structural Formula I or thereof and an insulin secretagogue such as biguanides, thiazolidinediones, sulfonylureas, insulin, or α -glucosidase inhibitors can be administered to the patient together in a single oral dosage composition such as a tablet or capsule, or each agent administered in separate oral dosage formulations. Where separate dosage formulations are used, a compound of Structural Formula I and one or more additional active agents can be administered at essentially the same time, i.e., concurrently, or at separately staggered times, i.e., sequentially; combination therapy is understood to include all these regimens.

An example of combination treatment or prevention of atherosclerosis may be wherein a compound of Structural Formula I or salts thereof is administered in combination with one or more of the following active agents:

- 20 -

antihyperlipidemic agents; plasma HDL-raising agents; antihypercholesterolemic agents, fibrates, vitamins, aspirin, and the like. As noted above, the compounds of Structural Formula I can be administered in combination with 5 more than one additional active agent.

Another example of combination therapy can be seen in treating diabetes and related disorders wherein the compounds of Structural Formula I, salts thereof can be effectively used in combination with, for example, 10 sulfonylureas, biguanides, thiazolidinediones, α -glucosidase inhibitors, other insulin secretagogues, insulin as well as the active agents discussed above for treating atherosclerosis.

The compounds of the present invention, and the 15 pharmaceutically acceptable salts, solvates and hydrates thereof, have valuable pharmacological properties and can be used in pharmaceutical compositions containing a therapeutically effective amount of a compound of the present invention, or pharmaceutically acceptable salts, 20 esters or prodrugs thereof, in combination with one or more pharmaceutically acceptable excipients. Excipients are inert substances such as, without limitation carriers, diluents, fillers, flavoring agents, sweeteners, lubricants, 25 solubilizers, suspending agents, wetting agents, binders, disintegrating agents, encapsulating material and other conventional adjuvants. Proper formulation is dependent upon the route of administration chosen. Pharmaceutical compositions typically contain from about 1 to about 99 weight percent of the active ingredient which is a compound 30 of the present invention.

- 21 -

Preferably, the pharmaceutical composition is in unit dosage form. A "unit dosage form" is a physically discrete unit containing a unit dose, suitable for administration in human subjects or other mammals. For example, a unit dosage form can be a capsule or tablet, or a number of capsules or tablets. A "unit dose" is a predetermined quantity of the active compound of the present invention, calculated to produce the desired therapeutic effect, in association with one or more pharmaceutically-acceptable excipients. The 5 quantity of active ingredient in a unit dose may be varied or adjusted from about 0.1 to about 1000 milligrams or more according to the particular treatment involved.

The dosage regimen utilizing the compounds of the present invention is selected by one of ordinary skill in the medical or veterinary arts, in view of a variety of factors, including, without limitation, the species, age, weight, sex, and medical condition of the recipient, the 15 severity of the condition to be treated, the route of administration, the level of metabolic and excretory function of the recipient, the dosage form employed, the 20 particular compound and salt thereof employed, and the like. Preferably, the compounds of the present invention are administered in a single daily dose, or the total daily dose may be administered in divided doses, two, three, or more 25 times per day. Where delivery is via transdermal forms, of course, administration is continuous.

Suitable routes of administration of pharmaceutical compositions of the present invention include, for example, 30 oral, eyedrop, rectal, transmucosal, topical, or intestinal administration; parenteral delivery (bolus or infusion), including intramuscular, subcutaneous, intramedullary injections, as well as intrathecal, direct intraven-

- 22 -

tricular, intravenous, intraperitoneal, intranasal, or intraocular injections. The compounds of the invention can also be administered in a targeted drug delivery system, such as, for example, in a liposome coated with endothelial cell-specific antibody.

For oral administration, the compounds can be formulated readily by combining the active compounds with pharmaceutically acceptable carriers well known in the art. Such carriers enable the compounds of the invention to be

10 formulated as tablets, pills, powders, sachets, granules, dragees, capsules, liquids, elixers, tinctures, gels, emulsions, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by combining the active compound with a solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores.

For oral administration in the form of a tablet or capsule, the active ingredient may be combined with an oral, non-toxic, pharmaceutically-acceptable carrier, such as, without limitation, lactose, starch, sucrose, glucose, methyl cellulose, calcium carbonate, calcium phosphate, calcium sulfate, sodium carbonate, mannitol, sorbitol, and the like; together with, optionally, disintegrating agents, such as, without limitation, cross-linked polyvinyl pyrrolidone, maize, starch, methyl cellulose, agar, bentonite, xanthan gum, alginic acid, or a salt thereof such as sodium alginate, and the like; and, optionally, binding agents, for example, without limitation, gelatin, acacia, natural sugars, beta-lactose, corn sweeteners, natural and synthetic gums, acacia, tragacanth, sodium alginate,

- 23 -

carboxymethyl-cellulose, polyethylene glycol, waxes, and the like; and, optionally, lubricating agents, for example, without limitation, magnesium stearate, sodium stearate, stearic acid, sodium oleate, sodium benzoate, sodium acetate, sodium chloride, talc, and the like. When a dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier such as a fatty oil.

Solid form formulations include powders, tablets and capsules. A solid carrier can be one or more substance which may also act as flavoring agents, lubricants, solubilisers, suspending agents, binders, tablet disintegrating agents and encapsulating material.

In powders, the carrier is a finely divided solid which is in admixture with the finely divided active ingredient. In tablets, the active ingredient is mixed with a carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. Various other materials may be present as coatings or

20 to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.

Sterile liquid formulations include suspensions, emulsions, syrups, and elixirs. The active ingredient can be dissolved or suspended in a pharmaceutically acceptable carrier, such as sterile water, sterile organic solvent, or 25 a mixture of both sterile water and sterile organic solvent. The active ingredient can also be dissolved in a suitable organic solvent, for example, aqueous propylene

glycol. Other compositions can be made by dispersing the finely divided active ingredient in aqueous starch or sodium carboxymethyl cellulose solution or in a suitable oil. 5 Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be 10 added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical preparations which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as 15 glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft 20 capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers may be added.

All formulations for oral administration should be in 25 dosages suitable for such administration. Particularly suitable compositions for oral administration are unit dosage forms such as tablets and capsules.

For parental administration the compounds of the present invention, or salts thereof, can be combined with 30 sterile aqueous or organic media to form injectable solutions or suspensions. Formulations for injection may be presented in unit dosage form, such as in ampoules or in

- 24 -

- 25 -

multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain 5 formulatory agents such as suspending, stabilizing and/or dispersing agents. The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to 10 the extent that each syringability exists. It must be stable under the conditions of manufacture and storage and must be preserved against any contamination. The carrier

can be solvent or dispersion medium containing, for example, water, preferably in physiologically compatible buffers such as Hanks's solution, Ringer's solution, or physiological saline buffer, ethanol, polyol (e.g. glycerol, propylene glycol and liquid polyethylene glycol), propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils. Under ordinary conditions of storage and 15 use, these preparations contain a preservative to prevent the growth of microorganisms.

The injectable solutions prepared in this manner can then be administered intraperitoneally, 20 subcutaneously, or intramuscularly, with intramuscular administration being preferred in humans.

For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art. The active 25 compounds can also be administered intranasally as, for example, liquid drops or spray.

- 26 -

For buccal administration, the compositions may take the form of tablets or lozenges formulated in a conventional manner.

For administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of a dry powder inhaler, or an aerosol spray presentation from pressurized packs or a nebuliser, with the use of a suitable propellant, e.g., dichlorodifluoromethane, trichlorofluoromethane,

10 dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of pressurized aerosol the dosage unit may be determined by providing a valve to deliver a metered amount. Capsules and cartridges of gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

Pharmaceutical compositions of the present invention can be manufactured in a manner that is itself known, e.g., by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing processes.

In making the compositions of the present invention, the active ingredient will usually be admixed with a carrier, or diluted by a carrier, or enclosed within a carrier which may be in the form of a capsule, sachet, paper or other container. When the carrier serves as a diluent, it may be a solid, lyophilized solid or paste, semi-solid, or liquid material which acts as a vehicle, or can be in the form of tablets, pills, powders, lozenges, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), or ointment, containing, for example, up to 10% by weight of the active

- 27 -

compound. The compounds of the present invention are preferably formulated prior to administration.

The following pharmaceutical formulations 1 through 8 are illustrative only and are not intended to limit the scope of the invention in any way. "Active Ingredient", refers to a compound according to Structural Formula I or salts thereof.

Formulation 1

10 Hard gelatin capsules are prepared using the following ingredients:

	Quantity (mg/capsule)
Active Ingredient	250
Starch, dried	200
Magnesium stearate	10
Total	460 mg

- 28 -

Formulation 2

A tablet is prepared using the ingredients below:

Active Ingredient	Quantity (mg/Tablet)
Cellulose, microcrystalline	250
Silicon dioxide, fumed	400
Stearic acid	10
Total	665 mg

5 The components are blended and compressed to form tablets each weighing 665 mg

Formulation 3

An aerosol solution is prepared containing the following components:

Active Ingredient	Weight
Ethanol	0.25
Propellant 22 (Chlorodifluoromethane)	25.75
Total	74.00

10 15 Total 100.00

The Active Ingredient is mixed with ethanol and the mixture added to a portion of the propellant 22, cooled to 30°C and transferred to a filling device. The required amount is then fed to a stainless steel container and diluted with the remainder of the propellant. The valve units are then fitted to the container.

Formulation 4

Tablets, each containing 60 mg of Active ingredient, are made as follows:

Active Ingredient	Quantity (mg/Tablet)
Starch	60 mg
Microcrystalline cellulose	45 mg
Polyvinylpyrrolidone (as 10% solution in water)	35 mg
Sodium carboxymethyl starch	4 mg
Magnesium stearate	4.5 mg
Talc	0.5 mg
Total	1 mg
	150 mg

5 The Active Ingredient, starch and cellulose are passed through a No. 45 mesh U.S. sieve and mixed thoroughly. The aqueous solution containing polyvinylpyrrolidone is mixed with the resultant powder, and the mixture then is passed through a No. 14 mesh U.S. sieve. The granules so produced are dried at 50°C and passed through a No. 18 mesh U.S. sieve. The sodium carboxymethyl starch, magnesium stearate and talc, previously passed through a No. 60 mesh U.S. sieve, are then added to the granules which, after mixing, are compressed on a tablet machine to yield tablets each weighing 150 mg.

Formulation 5

Capsules, each containing 80 mg of Active Ingredient, are made as follows:

Active Ingredient	80 mg	50 mg
Starch	59 mg	50 mg
Microcrystalline cellulose	59 mg	1.25 ml
Magnesium stearate	2 mg	0.10 ml
Total	200 mg	q.v.

5

The Active Ingredient, cellulose, starch, and magnesium stearate are blended, passed through a No. 45 mesh U.S. sieve, and filled into hard gelatin capsules in 200 mg quantities.

10

Formulation 6

Suppositories, each containing 225 mg of Active Ingredient, are made as follows:

15	Active Ingredient	225 mg	50 mg
	Saturated fatty acid glycerides	2,000 mg	1,250 mg
	Total	2,225 mg	1,750 mg

The Active Ingredient is passed through a No. 45 mesh U.S. sieve and suspended in the saturated fatty acid glycerides previously melted using the minimum heat necessary. The mixture is then poured into a suppository mold of nominal 2g capacity and allowed to cool.

Formulation 7

Suspensions, each containing 50 mg of Active Ingredient per 5 ml dose, are made as follows:

Active Ingredient	50 mg	50 mg
Sodium carboxymethyl cellulose	50 mg	1.25 ml
Syrup	50 mg	0.10 ml
Benzoic acid solution	50 mg	q.v.
Flavor	50 mg	q.v.
Color	50 mg	5 ml

Purified water to total

5

The Active Ingredient is passed through a No. 45 mesh U.S. sieve and mixed with the sodium carboxymethyl cellulose and syrup to form a smooth paste. The benzoic acid solution, flavor and color are diluted with a portion of the water and added, with stirring. Sufficient water is then added to produce the required volume.

Formulation 8

An intravenous formulation may be prepared as follows:

15	Active Ingredient	225 mg	100 mg
	Isotonic saline	2,225 mg	1,000 ml
	Total		

The solution of the above materials generally is administered intravenously to a subject at a rate of 1 ml per minute.

In yet another embodiment of the compounds of the present invention, the compound is radiolabelled, such as with carbon-14, or tritiated. Said radiolabelled or tritiated

SYNTHESIS

5 Compounds of the present invention have been formed by reacting a 2-(R₁-substituted)-5-R₂-substituted-oxazol-4-yl ethyl sulfonyl ester with a 2-R₄-substituted-(4-phenoxy)-alkanoic acid ester. Generally, the sulfonyl ester chemical intermediates have been synthesized through two different 10 routes, shown in Schemes IA and IB, while Scheme II is typical of the synthetic method used to make the propionic acid chemical intermediate. The formation of the compounds of the present invention from these chemical intermediates is shown in Scheme III.

15 In Scheme IA, the first step is a condensation of a dionemonooxime represented by Structural Formula IA-1 with a R₁-substituted aldehyde represented by Structural Formula IA-2 in the presence of an acid such as aqueous concentrated hydrochloric acid or, preferably, acetic acid which is 20 saturated with hydrogen chloride gas. Typically, hydrogen chloride is bubbled through a solution of the dionemonooxime and the R₁-substituted aldehyde in acetic acid, which is held at a constant temperature of about 0 °C to about 20 °C for about 15 minutes to about 1 hour. The product of the 25 condensation is an oxazole n-oxide represented by Structural Formula IA-3.

The oxazole n-oxide is then treated with phosphorous oxyhalide, such as phosphorous oxychloride or phosphorous oxybromide in an inert solvent such as dichloromethane or chloroform to form a 2-(R₁-substituted)-4-halomethyl-oxazole 30 represented by Structural Formula IA-4. The reaction to about 1.5 M borane complex in the ether solvent is added

- 33 -

typically is carried out at the reflux temperature of the solvent used and is complete in about 15 minutes to about 1 hour.

The 2-(R₁-substituted)-4-chloromethyl-oxazole is then 5 treated with a cyanide and an iodide salt to form a 2-(R₁-substituted)-4-cyanoethyl-oxazole represented by Structural Formula IA-5. The reaction is typically carried out in a polar, aprotic solvent such as dimethylformamide at a temperature of about 80°C to about 120°C for about 1 hour to 10 about 6 hours. Preferably, the cyanide and iodide salts are potassium cyanide and potassium iodide.

The cyano group of the a 2-(R₁-substituted)-4-cyanoethyl-oxazole is converted to a carboxylic acid group by treatment with a alkali metal hydroxide to form a 2-(R₁-substituted)-4-carboxymethyl-oxazole represented by 15 Structural Formula IA-6. The reaction is generally carried out in an aqueous solution at about 80°C to about 100°C. The concentration of the alkali metal hydroxide in the aqueous solution is typically about 25% to about 85% 20 (weight/volume). Preferably, the alkali metal hydroxide is potassium hydroxide.

The 2-(R₁-substituted)-4-carboxymethyl-oxazole is then 25 treated with a carboxylic acid reducing agent, such as borane or lithium aluminum hydride, to form the 2-(R₁-substituted)-4-(2-hydroxyethyl)-oxazole intermediate represented by Structural Formula IA-7. The reaction is typically carried out under anhydrous conditions in an ether solvent such as tetrahydrofuran (THF), dioxane, or ethyl 30 ether. When borane is the reducing agent used, it typically forms a complex with the ether solvent such as a BH₃-THF complex. A solution having a concentration of about 0.5 M to about 1.5 M borane complex in the ether solvent is added

- 34 -

dropwise to a solution of 0.1 M to 1.3 M of the 2-(R₁-substituted)-4-carboxymethyl-oxazole in the ether solvent.

The reaction temperature is about 20°C to about 40°C.

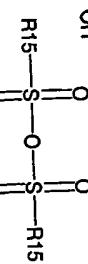

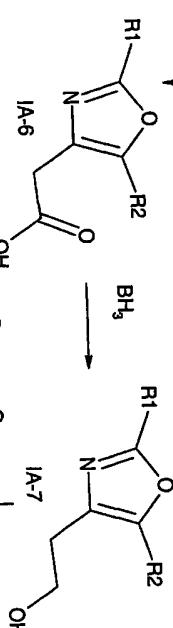

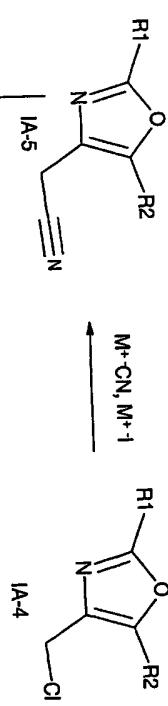

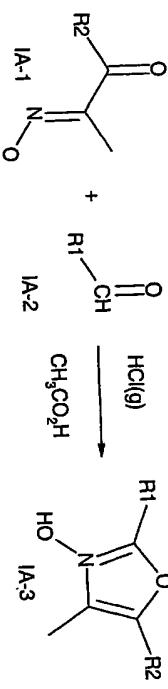

Typically, the reaction is complete in about 1 hour to about 5 hours.

The chemical intermediate, represented by Structural Formula IA-7, is then converted into a 2-(R₁-substituted-oxazol-4-yl)ethyl sulfonyl ester represented by Structural Formula IA-8 by treatment with a sulfonyl anhydride, such as

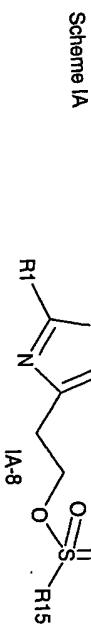

10 tosyl anhydride or mesyl anhydride, or a sulfonyl halide, such as tosyl chloride or mesyl chloride, in the presence of a base. The reaction is typically carried out in an aprotic solvent such as methylene chloride in the presence of

15 aprotic bases such as pyridine and N,N-dimethylaminopyridine (DMAP). The reaction is complete in about 0.5 hours to about 5 hours.

- 35 -

base

Scheme IA

- 36 -

In Scheme IB, the first step is a condensation of β -methyl L-aspartate represented by Structural Formula IB-1 with a R1-substituted acid chloride in the presence of mild base to form the amide represented by Structural Formula IB-3. Typically, the reaction is carried out in an acetone/water media in the presence of a carbonate base, such as potassium or sodium carbonate. The R1-substituted acid chloride is added to a solution of β -methyl L-aspartate in acetone/water at about 0°C to about 10°C and the reaction warms to ambient temperature for about 60 minutes to 2 hours.

The acid is then treated with a base such as pyridine and an anhydride such as acetic, n-propyl or trifluoroacetic anhydride to form the R2-substituted ketone represented by Structural Formula IB-4. The reaction is typically carried out at 90°C and is complete in about 90 minutes to about 2 hours.

Cyclo-dehydration of the R2-substituted ketone is completed with a protic acid such as sulfuric acid in the presence of acetic anhydride to form the 2-(R1-substituted)-5-(R2-substituted)-oxazole represented by Structural Formula IB-5. Alternatively, the ketone can be treated with a phosphorus oxyhalide, such as phosphorous oxychloride or phosphorous oxybromide in a polar, aprotic solvent such as dimethylformamide. In both methods, the reaction is heated to about 90°C and is complete in about 15 minutes to 30 minutes.

The 2-(R1-substituted)-5-(R2-substituted)-oxazole is treated with aqueous base, such as aqueous sodium hydroxide in an alcohol solvent at about 25°C to about 45°C for about

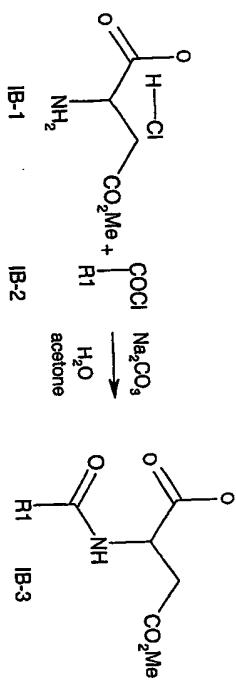

- 37 -

30 minutes to form the corresponding acid. The acid is treated with a carboxylic acid reducing agent, such as borane or lithium aluminum hydride, to form the 2-(R1-substituted)-4-(2-hydroxyethyl)-oxazole intermediate represented by Structural Formula IA-7. The reaction is typically carried out as described for the formation of the intermediate represented by Structural Formula IA-7 in Scheme IA.

In one method, shown in Scheme IIA, a 2-(bromophenyl)-5-substituted-oxazol-4-yl)ethoxy)-2-phenoxy)-alkanoic acid ester (Structural Formula IIA-3, R₂, R₃ and R₄ are terms are as previously defined for Structural Formulas I-III. The reaction is typically carried out in a polar, aprotic solvent such as dimethylformamide at about 40°C to about 70°C and is allowed to proceed for about 10 hours to about 24 hours. The reactants IIA-1 and IIA-2 are present in about equal molar amounts or with about 0.1M to about 0.5M excess of the sulfonyl ester compound. The cesium carbonate is present in about one molar equivalent to about 1.5 molar equivalents with respect to the sulfonyl ester.

The 2-(3-(2-(2-(bromophenyl)-5-substituted-oxazol-4-yl)ethoxy)-2-phenoxy)-alkanoic acid ester can be treated with a substituted or unsubstituted alkenyl or alkynyl tributyl tin in the presence of Pd(PPh₃)₄ to form 2-(3-(2-(alkenylphenyl)-5-substituted-oxazol-4-yl)ethoxy)-2-(2-(alkenylphenyl)-5-substituted-oxazol-4-yl)ethoxy)-2-phenoxy)-alkanoic acid ester or 2-(3-(2-(2-(alkynylphenyl)-5-substituted-oxazol-4-yl)ethoxy)-2-phenoxy)-alkanoic acid ester. The reaction is typically carried out at reflux temperature in a polar, aprotic solvent such as THF, and is complete in about 10 hours to about 20 hours. Optionally, the saturated functionality of the R₁₁ substitution can be reduced by hydrogen in the presence of a palladium on carbon catalyst to form the intermediate represented by Structural Formula IIA-5, where R₁₃ is C₁-C₄ alkyl, substituted or unsubstituted aryl-C₁-C₄ alkyl or heteroaryl-C₁-C₄ alkyl.

- 44 -

The compound represented by Structural Formula II-C-2 can be prepared by the method depicted in Scheme III. In this method, the benzylxophenol represented by Structural Formula III-1 is reacted with a α -haloester represented by Structural Formula III-2 in the presence of cesium carbonate to form a compound represented by Structural Formula III-3.

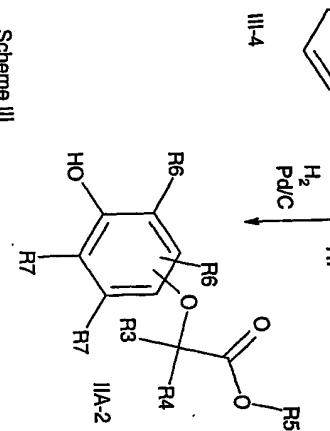

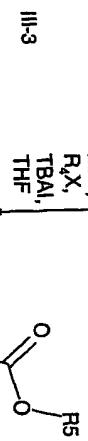

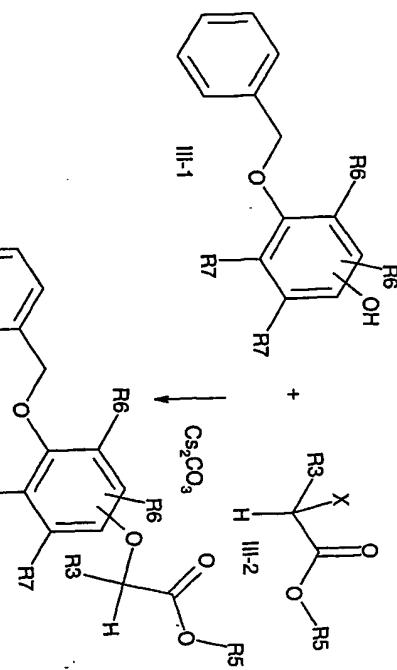

- 45 -

The reaction is carried out under anhydrous conditions in a polar, aprotic solvent such as dimethylformamide at about 40°C to about 80°C. The α -haloester and the cesium carbonate are present in about 1.5 to about 2.5 molar equivalents with respect to the benzylxophenol. Typically, the reaction is complete in about 10 hours to about 24 hours. The R4 substitution is introduced by formation of the enolate with a lithium alkylamide base, such as LDA, at -78 °C followed by addition of an unsubstituted or substituted alkyl or benzyl halide and TBAl to form the intermediate represented by Structural Formula III-4.

The compound represented by Structural Formula III-4 is then treated to remove the benzyl protecting group to form the phenol represented by Structural Formula II-C-2. Methods of removing a benzyl protecting group from a phenol can be found in Green, et al., *Protective Groups in Organic Synthesis*, 2nd edition, (1991), John Wiley & Sons, Inc., New York, pages 156-158, the entire teachings of which are incorporated herein by reference. A preferred method of removing a benzyl protecting group is by treating the compound represented by Structural Formula III-4 with hydrogen in the presence of palladium on carbon (Pd-C) catalyst.

When it is desired to prepare a compound represented by Structural Formula IIIA-2 in which at least one R6 or R7 group is other than hydrogen, the compound can be prepared by the method depicted in Scheme IV. A benzylxy-⁵ hydroxybenzaldehyde is treated with a Wittig reagent to form an alketyl-benzylxyphenol represented by Structural Formula XXVIII. R16 of the Wittig reagent is a C1-C5 alkyl, an aryl-C1-C5-alkyl, a cycloalkyl-C1-C3-alkyl, or a cycloalkyl-¹⁰ Conditions for carrying out a Wittig reaction are known to those skilled in the art. The alketyl-benzylxyphenol is then reacted as described in Scheme III to form the compound represented by Structural Formula IV-4.

Hydrolysis of alkanoic acid esters are typically carried out in an alcohol solvent in the presence of an excess of aqueous alkali metal hydroxide. The reaction is 5 heated at about 50 °C to about 60 °C and is allowed to proceed for about 10 hours to about 24 hours to form the alkanoic acids of the present invention.

EXEMPLIFICATION

Instrumental Analysis

Infrared spectra were recorded on a Perkin Elmer 781 spectrometer. 1H NMR spectra were recorded on a Varian 400 MHz spectrometer at ambient temperature. Data are reported as follows: chemical shift in ppm from internal standard tetramethylsilane on the δ scale, multiplicity (b = broad, 5 10 = singlet, d = doublet, t = triplet, q = quartet, qm = quintet and m = multiplet), integration, coupling constant (Hz) and assignment. ^{13}C NMR were recorded on a Varian 400 MHz spectrometer at ambient temperature. Chemical shifts are reported in ppm from tetramethylsilane on the δ scale, 10 with the solvent resonance employed as the internal standard ($CDCl_3$ at 77.0 ppm and $DMSO-d_6$ at 39.5 ppm). Combustion analyses were performed by Eli Lilly & Company.

Step B

2-Methyl-2-{4-[2-(2-phenyloxazol-4-yl)ethoxy]phenoxy}propionic acid, ethyl ester

5 4-[2-(2-Phenyl)oxazol-4-yl]ethoxy)phenol (3.7 g, 13.0 mmol) and cesium carbonate (4.71 g, 14.5 mmol) were suspended in anhydrous DMF (100 mL) and treated with dropwise addition of ethyl 2-bromoisoobutyrate (2.54 g, 13.0 mmol, 1.93 mL). The reaction mixture was stirred at ambient temperature for 24 h and then partitioned between ether (200 mL) and 1.0 N HCl (200 mL). The organic layer was washed with water (100 mL), dried over MgSO_4 and concentrated to a brown oil, which was purified by gradient column chromatography (200 mL SiO_2 , 100% hexanes to 20% EtOAc/hexanes) to provide 2-methyl-2-{4-[2-(2-phenyloxazol-4-yl)ethoxy]phenoxy}propionic acid, ethyl ester (2.54 g,

15 EtOAc/hexanes) to provide 2-methyl-2-{4-[2-(2-phenyloxazol-4-yl)ethoxy]phenoxy}propionic acid, ethyl ester (2.54 g,

10 mg, 0.35 mmol), copper (I) cyanide (96 mg, 1.07 mmol), and copper (I) iodide (120 mg, 0.63 mmol) were dissolved in dimethylformamide (1.5 mL) and heated to 150 °C for 20 h. The mixture was cooled ambient temperature and partitioned between EtOAc (20 mL) and saturated aqueous FeCl_3 (20 mL). The organic phase was washed with FeCl_3 solution, H_2O , brine and then dried (MgSO_4), filtered and concentrated. The product was purified by flash chromatography (15 mL SiO_2 , 40% EtOAc/hexanes) and obtained as a clear, colorless oil (132 mg, 87%). $\text{R}_f = 0.32$ in 35% EtOAc/hexanes; ^1H NMR (400

The reaction was then heated at 80 °C in an oil bath under a carbon monoxide balloon for 2 h. The reaction was cooled, diluted with Et_2O , and extracted with water and brine. The organic layer was dried ($MgSO_4$) and the solvent removed in vacuo to give an oil that passed over a plug of silica gel to remove most of the anisole (98:2 ratio $CH_2Cl_2:MeOH$). The resultant oil was dissolved in EtOH (8 mL) and treated with 5 N NaOH (0.1 mL) at reflux for 1 h. The reaction mixture was cooled, acidified with 1 N HCl (1 mL) and the reaction mixture extracted with EtOAc and water to give 0.061 g of crude 2-[4-(2-[4-(4-benzoyl-phenoxy)-phenyl]-5-methyl-oxazol-4-yl)-ethoxy]-2-methyl-

Step B

2,6-Diallyl-4-benzoyloxy-phenol

5 A mixture of 2-allyl-1-allyloxy-4-benzylaniline (DMA) (5 mL) was heated at reflux for 5h. The reaction was cooled and 1N H_2SO_4 (50 mL) was added. The product was extracted into

10 EtOAc (100 mL) and washed with 1N H_2SO_4 (2x100mL). The organic layer was dried (MgSO_4) and concentrated to a dark brown oil 5.45g. The crude product was purified by flash chromatography (300g silica gel/6% EtOAc /hexane) to give a yellow oil 3.10 (57%): ^1H NMR (CDCl_3) δ 3.44 (dd, 4H), 4.83 (s, 1H), 5.04 (s, 2H), 5.19 (dd, 4H), 5.97-6.14 (m, 2H), 6.72 (s, 2H), 7.33-7.52 (m, 5H), MS (ES) m/e 281 [M+1].

Step C

(2,6-Diallyl-4-benzoyloxy-phenoxo)-acetic acid ethyl ester

20 2,6-Diallyl-4-benzoyloxy-phenol (1.507 g, 5.37 mmol), ethyl bromoacetate (0.89 mL, 8.0 mmol), and cesium carbonate (1.75 g, 5.37 mmol) in dry DMF (15 mL) were heated at 85 °C for 18 h. The reaction mixture was cooled and partitioned between water (25 mL) and ethyl acetate (75 mL). The

25 organic layer was washed with brine (25 mL), dried (Na_2SO_4), and concentrated to an oil (2.08 g, 105%): ^1H NMR (CDCl_3) δ 1.32 (t, 3H, J = 7.3 Hz), 3.41 (d, 2H, J = 6.3 Hz), 4.28 (q, 2H, J = 7.3 Hz), 4.34 (s, 2H), 4.98 (s, 2H), 5.02-5.09 (m, 4H), 5.94 (ddt, 2H, J = 5.1, 10.3, 16.6 Hz), 6.68 (s, 2H), 7.29-7.42 (m, 5H).

3-Ethyl-4-[2-(5-methyl-2-phenyloxazol-4-yl)ethoxy]acetic acid ethyl ester

A mixture of 3-ethyl-4-[2-(5-methyl-2-phenyloxazol-4-yl)ethoxy]phenol (0.29 g, 0.90 mmol), ethyl bromoacetate (0.25 mL, 2.25 mmol) and cesium carbonate (0.45 g, (1.38 mmol) in anhydrous DME (4 mL) was heated for 24 h at 55°C.

The mixture was concentrated in vacuo, and the residue was partitioned between EtOAc (50 mL) and water (40 mL), washed with brine, dried (Na₂SO₄), and removed in vacuo to give a crude oil which was purified using radial chromatography eluting with 2% EtOAc/MeCl₂ to give a white solid (0.25g, 68%): ¹H NMR (400 MHz, CDCl₃) δ 7.97 (dd, J = 8.3, 2.4 Hz, 2H), 7.45-7.39 (m, 3H), 6.75 (dd, J = 8.3, 2.0 Hz, 2H), 6.12 (t, J = 6.5 Hz, 3H); MS (ES) m/e 410 (M⁺).

2-Methyl-2-(4-[2-(5-methyl-2-phenyl-thiazol-4-yl)-ethoxy]-phenoxy)-propionic acid ethyl ester

5 Thiobenzamide (7.3g) in toluene was heated at reflux for 1h in a flask equipped with a Dean-Stark trap. After 1.2 mL water was obtained, the dry thioamide (5.0g, 28 mmol) and 4-bromo-3-oxo-pentanoic acid methyl ester (9.0g, 43 mmol) were heated in toluene (200 mL) for 3 h. The cooled reaction was concentrated and purified by short path chromatography (400 g silica gel, 15% EtOAc/hexanes, then 20% EtOAc/hexanes). The fractions that contained pure product were concentrated to yield 3.53g (39%) ester as a yellow oil: ^1H NMR (CDCl_3) δ 2.36g (50%) alcohol as a light tan oil: ^1H NMR (CDCl_3) δ 2.42 (s, 3H), 2.94 (t, 2H), 4.03 (t, 2H), 7.39-7.47 (m, 3H), 7.85-7.93 (m, 2H).

Step A

2-(4-Dimethylthiocarbamoyloxy-phenoxy)-2-methyl-propionic acid ethyl ester

25 A DMF (100 mL) solution of 2-(4-hydroxyphenoxy)-2-methyl propionic acid ethyl ester (15.2 g, 67.7 mmol) and DABCO (15.2 g, 135.5 mmol) was charged dropwise with N,N-

- 192 -

dimethylthiocarbamoyl chloride (16.7 g, 135.5 mmol) in 20 mL DMF over 15 min. The reaction was stirred at rt for 18 h and then quenched with water. The reaction was partitioned between water (1L) and EtOAc (500 mL) and the organic layer washed with 1N HCl (500 mL). After drying (MgSO₄) and concentration, the crude product was obtained as a tan oil. Purification by flash chromatography (15% EtOAc/hexane) provided the product (15.8 g, 75%) as a pale yellow oil: ¹H NMR (CDCl₃) δ 1.32 (t, 3H), 1.65 (s, 6H), 3.37 (s, 3H), 3.50 (s, 3H), 4.30 (q, 2H), 6.93 (dd, 4H); MS (m/e) 312.

Step B

2-(4-Dimethylthiocarbamoylsulfanyl-phenoxy)-2-methyl-propionic acid ethyl ester

15 Neat (2-(4-dimethylthiocarbamoyloxyphenoxy)-2-methyl propionic acid ethyl ester (15 g, 48.2 mmol) was heated at 200°C for 1 h. TLC (20% EtOAc/hexane) showed that no reaction had occurred. The temperature was raised to 240°C for 30 min. By TLC, all starting material was gone and there was significant decomposition. Purification by short plug column (20% EtOAc/hexane) followed by prep HPLC gave the product (2.6g) as a pale yellow oil: ¹H NMR (CDCl₃) δ 1.27 (t, 3H), 1.63 (s, 6H), 3.05 (br s, 6H), 4.24 (q, 2H), 6.86 (d, 2H), 7.35 (d, 2H); MS (m/e) 312.

Step C

2-Methyl-2-[4-[2-(5-methyl-2-phenyloxazol-4-yl)ethoxy]sulfonyl]propionic acid ethyl ester

Freshly prepared NaOEt (from 50 mg (2.2 mmol) Na) was charged with 2-(4-dimethylthiocarbamoylsulfanyl-phenoxy)-2-methyl-propionic acid ethyl ester (420 mg, 1.35 mmol) and

refluxed for 3 h. Toluene-4-sulfonic acid 2-(5-methyl-2-phenyloxazol-4-yl)-ethyl ester (572 mg, 2.2 mmol) was added

and the mixture was refluxed for another 3 h. The reaction was cooled and concentrated. The residue was shaken with EtOAc/water. After a second water wash, the organic layer was dried (MgSO_4) and concentrated to give 500 mg crude product. Purification by flash chromatography (15% EtOAc/hexane) provided the product (98 mg, 17%): R_f = 0.32 in 15% EtOAc/hexane; MS m/e 426 (MH^+).

0.23 mmol) was dissolved in EtOH (10 mL) and 5N NaOH (0.5 mL) was added. The reaction was stirred overnight at rt.

The reaction was acidified with 5N HCl and the product was extracted into EtOAc, dried (MgSO_4) and concentrated to give

20 96 mg crude product. Purification by reverse phase HPLC gave 47.5 mg (52%) as a light tan solid: mp 104-105°C, ^1H NMR ($\text{DMSO}-\text{d}_6$) δ 1.47 (s, 6H), 2.26 (s, 3H), 2.71 (t, 2H),

Step A

2-(4-Hydroxy-naphthalen-1-ylxy)-2-methyl-propionic acid ethyl ester

10 A solution of naphthalene-1,4-diol (30.0 g, 187 mmol) was prepared in DMF (60 mL, anhydrous), cooled to 0 °C, and treated with NaH (7.50 g of a 60% solution in oil, 188 mmol) in portions, over a 5 min period. The ice bath was removed

and the mixture stirred for 30 min. The resulting black suspension was treated with ethyl 2-bromo-isobutyrate (27.6 mL, 188 mmol) and stirred at 95 °C for 18 h. The mixture was cooled to rt, then poured into cracked ice containing HCl (1 N aqueous, 200 mL). The aqueous layer was extracted with ethyl ether (3 x 500 mL) and the organic layers washed with brine (100 mL), dried (MgSO_4), filtered, and the

20 filtrate evaporated (40 °C, 20 mm Hg). The residue was chromatographed on SiO_2 (Biotage, 65M column; 18% EtOAc/hexanes) to afford a total of 19.2 g of 2-(4-hydroxy-naphthalen-1-ylxy)-2-methyl-propionic acid ethyl ester as a black oil 37% yield: R_f = 0.31 (20% EtOAc/hexanes); ^1H NMR (CDCl_3) δ 8.2 (m, 1H), 8.1 (m, 1H), 7.5 (m, 2H), 6.62 (dd, J

Step B

2-Methyl-2-(4-[2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy]-naphthalen-1-yl oxy)-propionic acid ethyl ester

A solution of 2-(4-hydroxy-naphthalen-1-yl oxy)-2-methyl-propionic acid ethyl ester (450 mg, 1.64 mmol) and toluene-4-sulfonic acid 2-(5-methyl-2-phenyl-oxazol-4-yl)-ethyl ester (700 mg, 1.96 mmol) was prepared in DMF (4 mL, anhydrous) under N_2 , treated with Cs_2CO_3 (638 mg, 1.96 mmol), and stirred at 60 °C for 18 h. The solution was poured into 1/1 H_2O /brine and extracted twice with 2/1 EtOAc/toluene. The organic layers were washed with brine, dried ($MgSO_4$), filtered, and the filtrate evaporated (40 °C, 20 mm Hg) to a residue. The residue was chromatographed on SiO_2 (Biotage, 40L column; 20% EtOAc/hexanes) to afford 440 mg of 2-methyl-2-[4-[2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy]-naphthalen-1-yl oxy] propionic acid ethyl ester as a colorless solid, 58% yield: 1H NMR (400 MHz, $CDCl_3$) δ 8.1 (m 2H), 7.94 (dd, $J = 8.0$, 1.6 Hz, 2H), 7.4 (m, 5H), 6.68 (d, $J = 8.6$ Hz, 1H), 6.62 (d, $J = 8.6$ Hz, 1H), 4.33 (t, $J = 6.4$ Hz, 2H), 4.21 (q, $J = 7.2$ Hz, 2H), 3.06 (t, $J = 6.4$ Hz, 2H), 2.36 (s, 3H), 1.59 (s, 6H), 1.20 (t, $J = 7.2$ Hz, 3H); MS (ES+) m/e (% relative intensity) 462.2 (16), 461.2 (72), 460.1 ($M^+ + 1$, 100).

Step C

2-Methyl-2-(4-[2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy]-naphthalen-1-yl oxy)-propionic acid

A solution of 2-methyl-2-[4-(2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy)-naphthalen-1-yl oxy]-propionic acid ethyl ester (440 mg, 91 μ mol) was prepared in THF (10 mL) and methanol (2 mL), treated with NaOH (2.0 mL of a 1 N aqueous solution, 2.0 mmol), and stirred for 4 h. The solution was acidified with HCl (400 μ L, 5 N aqueous, 2.0 mmol), and partitioned between water and EtOAc. The layers were separated and the organic layer dried ($MgSO_4$), filtered, and the filtrate evaporated (40 °C, 20 mm Hg). The residue was triturated with ethyl ether to afford 260 mg (2 crops) of 2-methyl-2-[4-(2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy)-naphthalen-1-yl oxy]-propionic acid as a pink powder, 63% yield: 1H NMR (400 MHz, $CDCl_3$) δ 8.1 (m 2H), 8.00 (d, $J = 8.8$ Hz, 2H), 7.4 (m, 5H), 6.87 (d, $J = 8.4$ Hz, 1H), 6.58 (d, $J = 8.4$ Hz, 1H), 4.27 (t, $J = 6.1$ Hz, 2H), 3.12 (t, $J = 6.1$ Hz, 2H), 2.42 (s, 3H), 1.62 (s, 6H); MS (ES+) m/e (% relative intensity) 433.2 (50), 432, 1.20 (t, $J = 7.2$ Hz, 3H).2 ($M^+ + 1$, 100).

Step A
5,6,7,8-Tetrahydronaphthalene-1,4-diol

A solution of naphthalene-1,4-diol (4.00 g, 25.0 mmol) was prepared in ethanol (95 mL) and acetic acid (25 mL), 10 treated with PtO₂ (0.60 g, 2.6mmol), charged with H₂ (60 psig), and shaken for 18h at 40 °C. The catalyst was filtered off and the filtrate evaporated (40 °C, 20 mm Hg). The residue was dissolved in EtOAc (100 mL) and washed with NaHCO₃ (saturated aqueous, 100 mL), brine (100 mL), dried (MgSO₄), filtered, and the filtrate evaporated (40 °C, 20 mm Hg) to afford a total of 2.6 g of 5,6,7,8-tetrahydro-

naphthalene-1,4-diol as a black solid, 63% yield: ¹H NMR (CDCl₃) δ 6.45 (s, 2H), 2.6 (m, 4H), 1.9 (m, 4H); MS (ES+) m/e (% relative intensity) 327.2 (100), 165.1 (M⁺ + 1, 26).

cooled to 0 °C, and treated with NaH (0.63 g of a 60% solution in oil, 15.8 mmol) in one portion. The ice bath was removed and the mixture stirred for 30 min. The resulting black suspension was treated with ethyl 2-bromoisobutyrate (2.33 mL, 15.9 mmol) and stirred at 100 °C for 18 h. The mixture was cooled to rt, then poured into cracked ice containing HCl (1 N aqueous, 20 mL). The aqueous layer was extracted with ethyl ether (3 x 50 mL) and the organic layers washed with brine (100 mL), dried (MgSO₄), filtered, and the filtrate evaporated (40 °C, 20 mm Hg). The residue was chromatographed on SiO₂ (Biotage, 40L column; 15% EtOAc/hexanes) to afford a total of 1.2 g of 2-(4-hydroxy-5,6,7,8-tetrahydronaphthalen-1-yloxy)-2-methyl-propionic acid ethyl ester as a black oil 27% yield: R_f = 0.27 (15% EtOAc in hexanes); ¹H NMR (CDCl₃) δ 6.42 (d, J = 8.6 Hz, 2H), 6.38 (d, J = 8.6 Hz, 2H), 4.20 (q, J = 7.2 Hz, 2H), 2.61 (t, J = 6.0 Hz, 2H), 2.55 (t, J = 6.0 Hz, 2H), 1.6 (m, 4H), 1.49 (s, 6H), 1.23 (t, J = 7.2 Hz, 3H); MS (ES+) m/e (% relative intensity) 301.1 (28), 279.2 (M⁺ + 1, 49), 233.1 (100), 205.1 (470), 165.1 (88).

Step C

2-Methyl-2-[4-[2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy]-5,6,7,8-tetrahydronaphthalen-1-yloxy] propionic acid ethyl ester

A solution of 2-(4-hydroxy-5,6,7,8-tetrahydronaphthalen-1-yloxy)-2-methyl propionic acid ethyl ester (400 mg, 1.44 mmol) and toluene-4-sulfonic acid 2-(5-methyl-2-phenyl-oxazol-4-yl) ethyl ester (608 mg, 1.70 mmol) was prepared in DMP (4 mL, anhydrous) under N₂, treated with Cs₂CO₃ (555 mg, 1.70 mmol), and stirred at 55 °C for 24 h,

then stirred over the week end at rt. The solution was poured into dilute aqueous HCl and extracted twice with EtOAc . The organic layers were washed with brine, dried (MgSO_4), filtered, and the filtrate evaporated (40 °C, 20 mm Hg) to a residue. The residue was chromatographed on SiO_2 (Biotage, 40S column; 15% $\text{EtOAc}/\text{hexanes}$) to afford 350 mg of 2-methyl-2-[4-(2-(5-methyl-2-phenyl-oxazol-4-yl)-ethoxy)-5,6,7,8-tetrahydronaphthalen-1-yloxy] propionic acid ethyl ester as a colorless solid, 52% yield: $^1\text{H NMR}$ (400 MHz, CDCl_3) δ 7.92 (dd, $J = 7.8, 1.8$ Hz, 2H), 7.3 (m, 3H), 6.4 (m, 2H), 4.19 (q, $J = 7.0$ Hz, 2H), 4.11 (t, $J = 6.4$ Hz, 2H), 2.91 (t, $J = 6.4$ Hz, 2H), 2.6 (m, 4H), 2.32 (s, 3H), 1.7 (m, 4H), 1.48 (s, 6H), 1.22 (t, $J = 7.0$ Hz, 3H); $\text{MS} (\text{ES}^+)$ m/e (relative intensity) 466.3 (16), 465.3 (70), 464.3 (M $^+$ + 1, 15 100).

Example 40

{4-[5-Methyl-2-(4-trifluoromethyl-phenyl)-oxazol-4-ylmethylsulfanyl]-2-propyl-phenoxy)-acetic acid

Step A

(2-Allyl-phenoxy)-acetic acid ethyl ester

A mixture of 2-allyl-phenol (10 g, 74.5 mmol), ethyl 2-bromoacetate (12.4 mL, 112 mmol) and cesium carbonate (36.5 g, 112 mmol) in DMF (180 mL) was heated at 60 °C overnight. The mixture was cooled and filtered through a pad of celite. The filtrate was diluted with water and extracted with ethyl acetate. The combined organic layers were washed with water, dried over sodium sulfate, filtered, and concentrated. The crude material was purified by column chromatography on silica gel to give 14.5 g of title compound. ¹H NMR (400 MHz, CDCl₃) • 7.19~7.14 (m, 2H), 6.97~6.92 (m, 1H), 6.73 (d, J = 8.1 Hz, 1H), 6.09~5.95 (m, 1H), 5.11~5.02 (m, 2H), 4.54 (s, 2H), 4.26 (q, J = 7.2 Hz, 2H), 3.46 (d, J = 6.8 Hz, 2H), 1.29 (t, J = 7.2 Hz, 3H).

Step B

(2-Propyl-phenoxy)-acetic acid ethyl ester

A solution of (2-allyl-phenoxy)-acetic acid ethyl ester (5.8 g, 26.3 mmol) in ethanol (200 mL) was treated with 5 % Pd/C (59 mg) and hydrogen at ambient temperature for overnight. The mixture was filtered and concentrated to give the title compound (5.7 g, 98%). ¹H NMR (400 MHz, CDCl₃) • 7.16~7.10 (m, 2H), 6.94~6.89 (m, 1H), 6.71 (d, J = 8.1 Hz, 1H), 4.53 (s, 2H), 4.26 (q, J = 7.2 Hz, 2H), 2.65 (t, J = 7.7 Hz, 2H), 1.71~1.60 (m, 2H), 1.29 (t, J = 7.0 Hz, 2H), 0.96 (t, J = 7.0 Hz, 3H); MS (ES) m/e 406.18 (M⁺).

(4-Mercapto-2-propyl-phenoxy)-acetic acid ethyl ester

A mixture of (4-chlorosulfonyl-2-propyl-phenoxy)-acetic acid ethyl ester (1.12 g, 3.5 mmol), tin powder (2.1 g) and HCl (4.0 M in dioxane, 4.4 mL) in ethanol (4.4 mL) was refluxed for 4 h, the mixture was poured into ice, extracted with methylene chloride. The combined organic layers were washed with brine, dried over sodium sulfate, concentrated to give the title compound, which was used for next step without purification.

(4-[5-Methyl-2-(4-trifluoromethyl-phenyl)-oxazol-4-ylmethylsulfanyl]-2-propyl-phenoxy)-acetic acid

To a mixture of (4-mercaptop-2-propyl-phenoxy)-acetic acid ethyl ester (127 mg, 0.5 mmol) and 4-Chloromethyl-5-methyl-2-(4-trifluoromethyl-phenyl)-oxazole (131 mg, 0.48 mmol) in acetonitrile (2 mL) was added cesium carbonate (326 mg, 1 mmol). After 4 h at room temperature, the reaction was quenched by water, extracted with ethyl acetate. Combined organic layers were washed with brine, dried (sodium sulfate) and concentrated. The residue was taken into THF (2 mL) and treated with lithium hydroxide (1N, 0.5 mL) at room temperature for 2 h. THF was evaporated, the residue was treated with water (0.5 mL) and extracted with ether. The

Binding and Cotransfection Studies

The in vitro potency of compounds in modulating PPAR α and PPAR γ receptors were determined by the procedures detailed below. DNA-dependent binding (ABCD binding) was carried out using SPA technology with PPAR receptors.

Tritium-labeled PPAR and PPAR agonists were used as radioligands for generating displacement curves and IC₅₀ values with compounds of the invention. Cotransfection assays were carried out in CV-1 cells. The reporter plasmid contained an acylCoA oxidase (AOX) PPRE and TK promoter

upstream of the luciferase reporter cDNA. Appropriate PPAR α and RXR α were constitutively expressed using plasmids containing the CMV promoter. For PPAR α and PPAR β ,

interference by endogenous PPAR in CV-1 cells was an issue. In order to eliminate such interference, a GAL4 chimeric

system was used in which the DNA binding domain of the transfected PPAR was replaced by that of GAL4, and the GAL4 response element was utilized in place of the AOX PPRE. Cotransfection efficacy was determined relative to PPAR α agonist and PPAR γ agonist reference molecules. Efficacies were determined by computer fit to a concentration-response curve, or in some cases at a single high concentration of agonist (10 μ M). For binding or cotransfection studies with receptors other than PPARs, similar assays were carried out using appropriate ligands, receptors, reporter constructs, etc., for that particular receptor.

These studies were carried out to evaluate the ability of compounds of the invention to bind to and/or activate various nuclear transcription factors, particularly hUPPAR α ("hu" indicates "human") and hUPPAR γ . These studies provide in vitro data concerning efficacy and selectivity of compounds of the invention. Furthermore, binding and cotransfection data for compounds of the invention were compared with corresponding data for marketed compounds that act on either hUPPAR α or hUPPAR γ .

Binding and cotransfection data for representative compounds of the invention are compared with corresponding data for reference compounds in Table II.

Treatments were test compounds (30 mg/kg), a positive control (fenofibrate, 100 mg/kg) or vehicle [1% carboxymethylcellulose (w/v) / 0.25% Tween80 (w/v); 0.2 ml/mouse]. Prior to termination on day 7, mice were weighed and dosed. Three hours after dosing, animals were anesthetized by inhalation of isoflurane (2-4%; Abbott Laboratories, Chicago, IL) and blood obtained via cardiac puncture (0.7-1.0 ml). Whole blood was transferred to serum separator tubes (Vacutainer SST), chilled on ice, and permitted to clot. Serum was obtained after centrifugation at 4°C and frozen until analysis for triglycerides, total cholesterol, compound levels, and serum lipoprotein profile by fast protein liquid chromatography (FPLC) coupled to an 15 inline detection system. After sacrifice by cervical dislocation, the liver, heart and epididymal fat pads were excised and weighed.

The animals dosed with vehicle had average triglycerides values of 60-80 mg/dl, which were reduced by 20 the positive control fenofibrate (33-58 mg/dl with a mean reduction of 37%). The animals dosed with vehicle had average total serum cholesterol values of 140-180 mg/dl, which were increased by fenofibrate (190-280 mg/dl, with a mean elevation of 41%). Triglyceride serum levels for 25 animals receiving compounds of the invention are reported in Table III in mg/dl. When subject to FPLC analysis, pooled sera from vehicle-treated hu apoAI transgenic mice had a high density lipoprotein cholesterol (HDLc) peak area which ranged from 47 v-sec to 62 v-sec. Fenofibrate increased the amount of HDLc (68-96 v-sec with a mean percent increase of 48%). Test compounds are reported in terms of percent

Evaluation of Glucose Levels in db/db Mice

Five week old male diabetic (db/db) mice [C57BLKS/j-m^{+/+} Lepr (db), Jackson Laboratory, Bar Harbor, ME] or lean littermates (db⁺) were housed 6 per cage (10"X20"X8" with aspen chip bedding) with food (Purina 5015) and water available at all times. After an acclimation period of 2 weeks, animals were individually identified by ear notches, weighed, and bled via the tail vein for determination of initial glucose levels. Blood was collected (100 μ l) from unfasted animals by wrapping each mouse in a towel, cutting the tip of the tail with a scalpel, and milking blood from the tail into a heparinized capillary tube (Fisher) balanced on the edge of the bench. Sample was discharged into a heparinized microtainer with gel separator (WWR) and

- 224 -

retained on ice. Plasma was obtained after centrifugation at 4°C and glucose measured immediately. Remaining plasma was frozen until the completion of the experiment, when glucose and triglycerides were assayed in all samples.

5 Animals were grouped based on initial glucose levels and body weights. Beginning the following morning, mice were dosed daily by oral gavage for 7 days using a 20 gauge, 1½" curved disposable feeding needle. Treatments were test compounds (30 mg/kg), a positive control agent (30 mg/kg) or 10 vehicle [1% carboxymethylcellulose (w/v) / 0.25% Tween80 (w/v); 0.3 ml/mouse]. On day 7, mice were weighed and bled (tail vein) 3 hours after dosing. Twenty-four hours after the 7th dose (i.e., day 8), animals were bled again (tail vein). Samples obtained from conscious animals on days 0, 7 15 and 8 were assayed for glucose. After the 24 hour bleed, animals were weighed and dosed for the final time. Three hours after dosing on day 8, animals were anesthetized by inhalation of isoflurane and blood obtained via cardiac puncture (0.5-0.7 ml). Whole blood was transferred to serum separator tubes, chilled on ice and permitted to clot.

Serum was obtained after centrifugation at 4°C and frozen until analysis for compound levels. After sacrifice by cervical dislocation, the liver, heart and epididymal fat pads were excised and weighed.

20 The animals dosed with vehicle had average triglycerides values of 170-230 mg/dl, which were reduced by the positive PPAR_γ control (70-120 mg/dl with a mean reduction of 50%). Male db/db mice were hyperglycemic (average glucose of 680-730 mg/dl on the 7th day of treatment), while lean animals had average glucose levels 25 between 190-230 mg/dl. Treatment with the positive control

- 225 -

agent reduced glucose significantly (350-550 ng/dl with a mean decrease towards normalization of 56%). Test compounds are reported in Table V in terms of glucose normalization (i.e., 100% normalization would be glucose levels in treated 5 db/db mice which did not differ from lean values).

Glucose was measured colorimetrically using commercially purchased reagents (Sigma #315-500). According to the manufacturers, the procedures were modified from published work (McGowan, M. W., Artiss, J. D., Strandbergh, D. R. & Zak, B. Clin Chem, 20:470-5 (1974) and Keston, A. 10 Specific colorimetric enzymatic analytical reagents for glucose. Abstract of papers 129th Meeting ACS, 31C (1956); and depend on the release of a mole of hydrogen peroxide for each mole of analyte, coupled with a color reaction first described by Trinder (Trinder, P. Determination of glucose 15 in blood using glucose oxidase with an alternative oxygen acceptor. Ann Clin Biochem, 6:24 (1969)). The absorbance of the dye produced is linearly related to the analyte in the sample. The assays were further modified in our laboratory 20 for use in a 96 well format. Standards (Sigma #339-11, Sigma #16-11, and Sigma #C0534 For glucose, triglycerides and total cholesterol, respectively), quality control plasma (Sigma # A2034), and samples (2. or 5 µl/well) were measured in duplicate using 200 µl of reagent. An additional aliquot 25 of sample, pipetted to a third well and diluted in 200 µl water, provided a blank for each specimen. Plates were incubated at room temperature (18, 15, and 10 minutes for glucose, triglycerides and total cholesterol, respectively) on a plate shaker (DPC Micromix 5) and absorbance read at 30 500 nm (glucose and total cholesterol) or 540 nm (triglycerides) on a plate reader (Wallac Victor 1420).

- 226 -

- 227 -

Sample absorbances were compared to a standard curve (100-800, 10-500, and 100-400 mg/dl for glucose, triglycerides and total cholesterol, respectively). Values for the quality control samples were always within the expected range and the coefficient of variation for samples was below 10%.

All samples from an experiment were assayed at the same time to minimize inter-assay variability.

Serum lipoproteins were separated and cholesterol

quantitated with an in-line detection system. Sample was applied to a Superose® 6 HR 10/30 size exclusion column

(Amersham Pharmacia Biotech) and eluted with phosphate buffered saline-EDTA at 0.5 ml/min. Cholesterol reagent (Roche Diagnostics Chol/HP 704036) at 0.16 ml/min mixed with

the column effluent through a T-connection and the mixture passed through a 15 m x 0.5 mm id knitted tubing reactor

immersed in a 37 C water bath. The colored product produced in the presence of cholesterol was monitored in the flow stream at 505 nm and the analog voltage from the monitor was converted to a digital signal for collection and analysis.

The change in voltage corresponding to change in cholesterol concentration was plotted vs time and the area under the curve corresponding to the elution of VLDL, LDL and HDL was calculated using Perkin Elmer Turbochrome software.

EQUIVALENTS

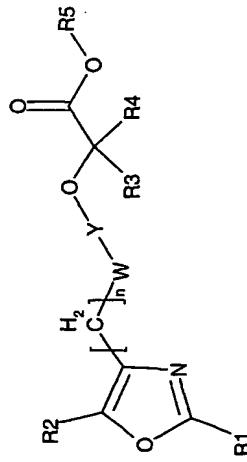

5
While this invention has been particularly shown and described with references to preferred embodiments thereof, it will be understood by those skilled in the art that various changes in form and details may be made therein 10 without departing from the scope of the invention encompassed by the appended claims.

CLIMATE

We claim:

5 1. A compound represented by the following structural formula:

and pharmaceutically acceptable salts, solvates and hydrates thereof, wherein:

卷之三

H_2C_7

is a polymethylene chain, which is saturated or may contain a carbon-carbon double bond.

n is 2, 3, or 4;

R1 is an unsubstituted or substituted group selected from aryl, heteroaryl, cycloalkyl, aryl-C1-C4 alkyl, heteroaryl-C1-C4 alkyl or cycloalkyl-C1-C4 alkyl;
 R2 is H, C1-C4 alkyl or C1-C4 haloalkyl;
 Y is an unsubstituted or substituted group selected

from phenylene, naphthylene or 1,2,3,4-tetrahydronaphthylene;

30 formula: *i.e.* a compound

88

R4 is H, C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or unsubstituted benzyl, with the exception that when R3 and R4 are H, R2 is C1-C4 alkyl or haloalkyl; and

5 1. A compound represented by the following structural formula:

$$\begin{array}{c}
 \text{R5} \\

hydrates thereof, wherein:

$$\text{H}_2\text{C}=\text{CH}_2$$

20 8. A compound of Claims 1, 2, 3, 4, 5, 6, or 7 where
 substituted or unsubstituted 2-thienyl.
 is methyl.

25 9. A compound of Claim 8 wherein R4 is methyl.

10. A compound of Claims 1-9 wherein R5 is H.

11. A compound represented by the following structural formula:

۷۳۲

C1-C4 alkyl, or aryl-C1-C4 alkyl;
 R8 is C1-C4 alkyl or C1-C4 haloalkyl;
 R9 is C1-C6 alkyl or C1-C6 haloalkyl; and
 R10 is C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or
 unsubstituted benzyl; and
 R11 are each, independently, halo, hydroxy, carboxy,
 saturated or unsaturated C1-C4 alkyl, C1-C4 alkoxyl,
 C1-C4 haloalkyl, C1-C4 haloalkoxyl, cyano, carbamoyl,
 dioxaborolan-2-yl, benzoyl, or a substituted or
 unsubstituted group selected from aryl-C1-C4-alkyl,
 aryloxy, cycloalkyl, cycloalkyloxy or heterocyclo-oxy.

19. A compound represented by the following structural

formula:

2

with the phenyl to which they are bound form naphthyl or 1,2,3,4-tetrahydronaphthyl; R7 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-C1-C4 alkyl, or ary1-C1-C4 alkyl; R8 is C1-C4 alkyl or C1-C4 haloalkyl; R9 is C1-C6 alkyl or C1-C6 haloalkyl; and R10 is C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or unsubstituted benzyl; and R12 is H, ary1 or C1-C4 alkyl.

21. A compound of Claims 1-19 wherein said compound is
trinitated

and pharmaceutically acceptable salts, solvates and hydrates thereof, wherein:

R5 is H, C1-C4 alkyl or aminoalkyl;

R6 are each, independently, H, halo, C1-C6 alkyl, C1 alkoxyl, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl, cycloalkyl-C1-C4 alkyl, aryl-C1-C4 alkyl, or together

6

with the phenyl to which they are bound form naphthyl-1 or 1,2,3,4-tetrahydronaphthyl; R7 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxyl, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-

or unsubstituted benzyl; and R11 are each, independently, halo, hydroxy, carboxy, saturated or unsaturated C1-C4 alkyl, C1-C4 alkoxy, C1-C4 haloalkyl, C1-C4 haloalkoxy, cyano, carbamoyl, dioxaborolan-2-yl, benzoyl, or a substituted or unsubstituted group selected from aryl-C1-C4-alkyl, aryloxy, cycloalkyl, cycloalkyloxy or heterocyclo-oxy.

19. A compound represented by the following structural

formula:

22. A pharmaceutical composition, comprising a pharmaceutically acceptable carrier and at least one compound of Claims 1-19, or a pharmaceutically acceptable salt, solvate or hydrate thereof.

23. A method of modulating a peroxisome proliferator activated receptor, comprising the step of contacting the receptor with at least one compound of Claims 1-19, or a pharmaceutically acceptable salt, solvate or hydrate thereof.

2-2. The method of Figure 2-2, wherein the permeable proliferator activated receptor is an α receptor.

- 234 -

- 235 -

25. The method of Claim 23, wherein the peroxisome proliferator activated receptor is an γ receptor.

26. A method of treating diabetes mellitus in a mammal, comprising the step of administering to the mammal a therapeutically effective amount of at least one compound of Claims 1-19, or a pharmaceutically acceptable salt, solvate or hydrate thereof.

10 27. A method of preventing diabetes mellitus in a mammal, comprising the step of administering to the mammal an effective amount of at least one compound of Claims 1-19, or a pharmaceutically acceptable salt, solvate or hydrate thereof.

15 28. The method of Claim 26 or 27 wherein the mammal is a human.

20 29. The method of Claim 28 wherein the compound potentiates a peroxisome proliferator activated receptor.

15 30. The method of Claim 29 wherein the peroxisome proliferator activated receptor is an α receptor.

20 31. The method of Claim 27 wherein the compound lowers blood glucose levels.

25 32. The method of Claim 29 wherein the peroxisome proliferator activated receptor is a γ receptor.

30 33. The method of Claim 27 wherein the compound lowers blood glucose levels.

10 34. The method of Claims 32 or 33 wherein the mammal is a human.

15 35. The method of Claim 34, wherein the compound potentiates a peroxisome proliferator activated receptor.

20 36. The method of Claim 35 wherein the peroxisome proliferator activated receptor is an α receptor.

25 37. The method of Claims 32 or 33 wherein the compound lowers triglycerides in the mammal.

30 38. The method of Claims 32 or 33 wherein the compound lowers low density lipoproteins in the mammal.

35 39. The method of Claims 32 or 33 wherein the compound increases high density lipoproteins in a mammal.

30 40. A method of treating Syndrome X in a mammal, comprising the step of administering to the mammal a therapeutically effective amount of at least one

- 240 -

R5 is H, C1-C4 alkyl or aminoalkyl;
 R6 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl, cycloalkyl-C1-C4 alkyl, aryl-C1-C4 alkyl, or together with the phenyl to which they are bound form naphthyl or 1,2,3,4-tetrahydronaphthyl;

5 R7 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxyl, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-C1-C4 alkyl, or aryl-C1-C4 alkyl or C1-C6alkoxybenzyl,

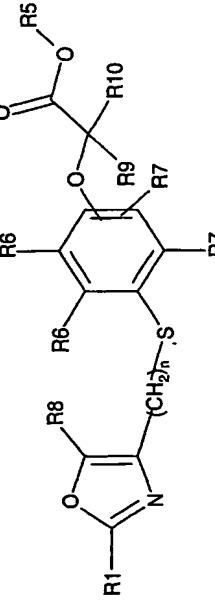

10 C1-C6 alkoxaryl or a group of the formula
 R8 is C1-C4 alkyl or C1-C4 haloalkyl;
 R9 is C1-C6 alkyl or C1-C6 haloalkyl;
 R10 is C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or unsubstituted benzyl; and

15 R13 is selected from the group consisting of benzyl, substituted benzyl, aryl, substituted aryl, substituted C1-C6 cycloalkyl, C1-C6 cycloalkyl and C1-C6 alkyl.

55. A compound of Claim 54 wherein R13 is selected from the group consisting of is selected from the group consisting of benzyl, substituted benzyl, C1-C6 cycloalkyl, C1-C6 alkyl.

20 56. A compound of the formula:

25 R8 is C1-C4 alkyl or C1-C4 haloalkyl; R9 is C1-C6 alkyl or C1-C6 haloalkyl; R10 is C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or unsubstituted benzyl; and R13 is selected from the group consisting of benzyl, substituted benzyl, aryl, substituted aryl, substituted C1-C6 cycloalkyl, C1-C6 cycloalkyl and C1-C6 alkyl.

57. A compound of Claim 56 wherein n is 1.

58. A compound of Claim 56 wherein n is 2.

59. A compound of any one of Claims 56, 57, or 58 wherein R13 is selected from the group consisting of is

and pharmaceutically acceptable salts, solvates and

- 241 -

hydrates thereof, wherein:

n is 1, 2, or 3;
 R1 is an unsubstituted or substituted group selected from aryl, heteroaryl, cycloalkyl, aryl-C1-C4 alkyl, heteroaryl-C1-C4 alkyl or cycloalkyl-C1-C4 alkyl;

5 R5 is H, C1-C4 alkyl or aminoalkyl;

R6 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-C1-C4 alkyl, or aryl-C1-C4 alkyl, or together with the phenyl to which they are bound form naphthyl or 1,2,3,4-tetrahydronaphthyl;

40 R7 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-C1-C4 alkyl, or aryl-C1-C4 alkyl or C1-C6alkoxybenzyl, with the phenyl to which they are bound form naphthyl or 1,2,3,4-tetrahydronaphthyl;

R8 are each, independently, H, halo, C1-C6 alkyl, C1-C6 alkoxy, C1-C6 haloalkyl, C1-C6 haloalkoxy, cycloalkyl-C1-C4 alkyl, or aryl-C1-C4 alkyl or C1-C6alkoxybenzyl,

C1-C6 alkoxaryl or a group of the formula

formula ;

5 R8 is C1-C4 alkyl or C1-C4 haloalkyl; R9 is C1-C6 alkyl or C1-C6 haloalkyl; R10 is C1-C10 alkyl, C1-C10 haloalkyl, or a substituted or unsubstituted benzyl; and R13 is selected from the group consisting of benzyl, substituted benzyl, aryl, substituted aryl, substituted C1-C6 cycloalkyl, C1-C6 cycloalkyl and C1-C6 alkyl.

57. A compound of Claim 56 wherein n is 1.

58. A compound of Claim 56 wherein n is 2.

59. A compound of any one of Claims 56, 57, or 58 wherein R13 is selected from the group consisting of is

- 242 -

selected from the group consisting of benzyl, substituted benzyl, C1-C6 cycloalkyl, C1-C6 alkyl.
